Set Theory Relationship Mapping (STRM)

Reference Document: Secure Controls Framework (SCF) version 2024.3

Focal Document: NIST SP 800-218 Secure Software Development Framework (SSDF) Version 1.1

Focal Document Source: https://csrc.nist.gov/pubs/sp/800/218/final

STRM URL: https://securecontrolsframework.com/content/strm/scf-2024-3-nist-800-218.pdf

Set Theory Relationship Mapping (STRM) is well-suited for mapping between sets of elements that exist in two distinct concepts that are mostly the same as each other (e.g., cybersecurity & data privacy requirements). STRM also allows the strength of the mapping to be captured.

STRM relies on a justification for the relationship claim. There are three (3) options for the rationale, which is a high-level context within which the two concepts are related:

- 1. Syntactic: How similar is the wording that expresses the two concepts? This is a word-for-word analysis of the relationship, not an interpretation of the language.
- 2. Semantic: How similar are the meanings of the two concepts? This involves some interpretation of each concept's language.
- 3. Functional: How similar are the results of executing the two concepts? This involves understanding what will happen if the two concepts are implemented, performed, or

Based on NIST IR 8477, STRM supports five (5) five relationship types to describe the logical similarity between two distinct concepts:

- 1. Subset Of
- 2. Intersects With
- 3. Equal
- 4. Superset Of
- 5. No Relationship

Relationship Type #1: SUBSET OF

Focal Document Element is a subset of SCF control. In other words, SCF control contains everything that Focal Document Element does and more.

Relationship Type #2: INTERSECTS WITH

SCF control has some overlap with Focal Document Element, but each includes content that the other does not.

Relationship Type #3: **EQUAL**

SCF control and Focal Document Element are the same, although not necessarily identical

Relationship Type #4: SUPERSET OF

Focal Document Element is a superset of SCF control. In other words. Focal Document Element contains everything that SCF control does and

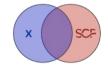

Relationship Type #5: NO RELATIONSHIP

SCF control and Focal Document Element are unrelated; their content does not overlap

SUBSET OF Relative Relationship

Strength (control versus control)

INTERSECTS WITH

Relative Relationship Strength (control versus control)

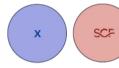

EOUAL

Relative Relationship Strength (control versus control)

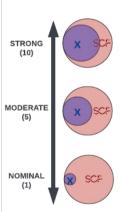

SUPERSET OF

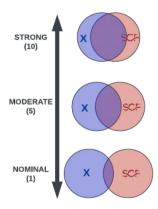

Relative Relationship Strength (control versus control)

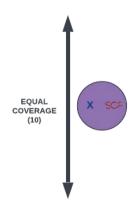

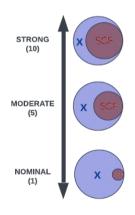

NO RELATIONSHIP

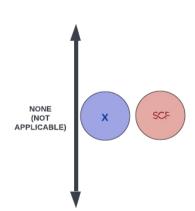

Relative Relationship Strength (control versus control)

PW.9	_	Help improve the security of the software at the time of installation to reduce the likelihood of the software being deployed with weak security settings, putting it at greater risk of compromise.	Functional	Equal	Secure Settings By Default	TDA-09.6	Mechanisms exist to implement secure configuration settings by default to reduce the likelihood of software being deployed with weak security settings that would put		
			Functional	Equal	System Hardening Through Baseline Configurations	CFG-02	Mechanisms exist to develop, document and maintain secure baseline configurations for technology platforms that are consistent with industry-accepted system hardening		Example 1: Conduct testing to ensure that the settings, including the default settings, are working as expected and are not inadvertently causing any security weaknesses, operational issues, or other problems.
PW.9.1		Define a secure baseline by determining how to configure each setting that has an effect on security or a security-related setting so that the default settings are secure and do not weaken the	Functional	Intersects With	Minimum Viable Product (MVP) Security Requirements	TDA-02	Mechanisms exist to ensure risk-based technical and functional specifications are established to define a Minimum Viable Product (MVP).		
		security functions provided by the platform, network infrastructure, or services.	Functional	Intersects With	Pre-Established Secure Configurations	TDA-02.4	Mechanisms exist to ensure vendors / manufacturers: Deliver the system, component, or service with a pre-established, secure configuration Mechanisms exist to implement secure		
			Functional	Intersects With	Secure Settings By Default	TDA-09.6	configuration settings by default to reduce the likelihood of software being deployed with weak security settings that would put Mechanisms exist to implement secure configuration settings by default to reduce the likelihood of software being deployed with weak security settings that would put		Example 1: Verify that the approved configuration is in place for
			Functional	Intersects With	Minimum Viable Product (MVP) Security Requirements	TDA-02	technical and functional specifications are established to define a Minimum Viable Product (MVP). Mechanisms exist to ensure vendors /		the software. Example 2: Document each setting's purpose, options, default value, security relevance, potential operational impact, and
PW.9.2	N/Δ	Implement the default settings (or groups of default settings, if applicable), and document each setting for software administrators.	Functional	Intersects With	Pre-Established Secure Configurations	TDA-02.4	manufacturers: • Deliver the system, component, or service with a pre-established, secure configuration Mechanisms exist to implement secure		
			Functional	Intersects With	Secure Settings By Default	TDA-09.6	configuration settings by default to reduce		
		Help ensure that vulnerabilities are identified more quickly so that they can be remediated more quickly in accordance with risk, reducing the window of opportunity for attackers.	Functional	Intersects With	Development Methods, Techniques & Processes	TDA-02.3	developers to ensure that their software development processes employ industry-recognized secure practices for secure Mechanisms exist to include appropriate		
	I VIIIneraniiities on an Ungoing		Functional	Intersects With	Cybersecurity & Data Privacy Representatives For Product Changes	TDA-02.7	cybersecurity & data privacy representatives in the product feature and/or functionality change control review process. Mechanisms exist to have an independent		
RV.1			Functional	Intersects With	Software Design Review	TDA-06.5	are met and that any identified risks are Mechanisms exist to require system		
			Functional	Subset Of	Cybersecurity & Data Privacy Testing Throughout Development	TDA-09	developers/integrators consult with cybersecurity & data privacy personnel to: • Create and implement a Security Test and Mechanisms exist to require the developers		
			Functional	Intersects With	Continuous Monitoring Plan	TDA-09.1	of systems, system components or services to produce a plan for the continuous monitoring of cybersecurity & data privacy Mechanisms exist to obtain, protect and distribute administrator documentation for		Example 1: Monitor vulnerability databases , security mailing
			Functional	Intersects With	Documentation Requirements	TDA-04	systems that describe: Secure configuration, installation and		lists, and other sources of vulnerability reports through manual or automated means. Example 2: Use threat intelligence sources to better understand
RV.1.1		Gather information from software acquirers, users, and public sources on potential vulnerabilities in the software and third-party components that the software uses, and investigate all credible reports.	Functional	Intersects With	Functional Properties	TDA-04.1	Mechanisms exist to require software developers to provide information describing the functional properties of the security controls to be utilized within systems, system		
			Functional	Intersects With	Software Bill of Materials (SBOM)	TDA-04.2	Mechanisms exist to generate a Software Bill of Materials (SBOM) for systems, applications and services that lists software packages in use, including versions and applicable Mechanisms exist to require the developers		
			Functional	Intersects With	Developer Architecture & Design	TDA-05	of systems, system components or services to produce a design specification and security architecture that: Mechanisms exist to have an independent		Example 1: Configure the toolchain to perform automated code
RV.1.2	N/A	Review, analyze, and/or test the software's code to identify or confirm the presence of previously undetected vulnerabilities.	Functional	Subset Of	Software Design Review	TDA-06.5	review of the software design to confirm that all cybersecurity & data privacy requirements are met and that any identified risks are Mechanisms exist to establish a Vulnerability		analysis and testing on a regular or continuous basis for all supported releases. Example 2: See PW.7 and PW.8. Example 1: Establish a vulnerability disclosure program, and
RV.1.3	N/A	Have a policy that addresses vulnerability disclosure and remediation, and implement the roles, responsibilities, and processes needed to support that policy.	Functional	Equal	Vulnerability Disclosure Program (VDP)	THR-06	Disclosure Program (VDP) to assist with the secure development and maintenance of products and services that receives Mechanisms exist to require software		make it easy for security researchers to learn about your program and report possible vulnerabilities. Example 2: Have a Product Security Incident Response Team
RV.2		Help ensure that vulnerabilities are remediated in accordance with risk to reduce the window of opportunity for attackers.	Functional	Intersects With	Development Methods, Techniques & Processes Cybersecurity & Data	TDA-02.3	developers to ensure that their software development processes employ industry-recognized secure practices for secure Mechanisms exist to require system		
			Functional	Subset Of	Privacy Testing Throughout Development Cybersecurity & Data	TDA-09	developers/integrators consult with cybersecurity & data privacy personnel to: • Create and implement a Security Test and Mechanisms exist to require system		Example 1: Use existing issue tracking software to record each
RV.2.1	N/Δ	Analyze each vulnerability to gather sufficient information about risk to plan its remediation or other risk response.	Functional	Subset Of	Privacy Testing Throughout Development	TDA-09	developers/integrators consult with cybersecurity & data privacy personnel to: • Create and implement a Security Test and		vulnerability. Example 2: Perform risk calculations for each vulnerability based on estimates of its exploitability, the potential impact if
			Functional	Intersects With	Product Management	TDA-01.1	Mechanisms exist to design and implement product management processes to update products, including systems, software and services, to improve functionality and correct Mechanisms exist to perform threat		Example 1: Make a risk-based decision as to whether each vulnerability will be remediated or if the risk will be addressed through other means (e.g., risk acceptance, risk transference), and prioritize any actions to be taken.
RV.2.2	N/A	Plan and implement risk responses for vulnerabilities.	Functional	Intersects With	Threat Modeling	TDA-06.2	modelling and other secure design		
	14/7	a and implement for responses for vullerabilities.	Functional	Subset Of	Cybersecurity & Data Privacy Testing Throughout Development	TDA-09	developers/integrators consult with cybersecurity & data privacy personnel to: • Create and implement a Security Test and Mechanisms exist to ensure that		
			Functional	Intersects With	Vulnerability Remediation Process	VPM-02	vulnerabilities are properly identified, tracked and remediated.		
RV 3	Analyze Vulnerabilities to Identify	Heln reduce the frequency of vulnerabilities in the future	Functional	Subset Of	Product Management	TDA-01.1	Mechanisms exist to design and implement product management processes to update products, including systems, software and services, to improve functionality and correct		

FDE#	FDE Name	Focal Document Element (FDE) Description	STRM Rationale	STRM Relationship	SCF Control	SCF #	Secure Controls Framework (SCF) Control Description	Strengtn of Relationship	Notes (optional)
IVV.5	Their Root Cause	Theip reduce the frequency of valuerabilities in the fature.	Functional	Intersects With	Root Cause Analysis (RCA) & Lessons Learned	IRO-13	Mechanisms exist to incorporate lessons learned from analyzing and resolving cybersecurity & data privacy incidents to reduce the likelihood or impact of future		
RV.3.1	N/A	Analyze identified vulnerabilities to determine their root causes.	Functional	Subset Of	Cybersecurity & Data Privacy Testing Throughout Development	TDA-09	Mechanisms exist to require system developers/integrators consult with cybersecurity & data privacy personnel to: • Create and implement a Security Test and		Example 1: Record the root cause of discovered issues. Example 2: Record lessons learned through root cause analys in a wiki that developers can access and search.
RV.3.2	N/A	Analyze the root causes over time to identify patterns, such as a particular secure coding practice not being followed consistently.	Functional	Subset Of	Cybersecurity & Data Privacy Testing Throughout Development	TDA-09	Mechanisms exist to require system developers/integrators consult with cybersecurity & data privacy personnel to: • Create and implement a Security Test and		Example 1: Record lessons learned through root cause analys in a wiki that developers can access and search. Example 2: Add mechanisms to the toolchain to automatically detect future instances of the root cause.
DV 2.2	N/A	Review the software for similar vulnerabilities to eradicate a class of vulnerabilities, and proactively fix them rather than waiting for external reports.	Functional	Subset Of	Product Management	TDA-01.1	Mechanisms exist to design and implement product management processes to update products, including systems, software and services, to improve functionality and correct		Example 1: See PW.7 and PW.8.
RV.3.3	N/A		Functional	Intersects With	Cybersecurity & Data Privacy Testing Throughout Development	TDA-09	Mechanisms exist to require system developers/integrators consult with cybersecurity & data privacy personnel to: • Create and implement a Security Test and		
			Functional	Subset Of	Technology Development & Acquisition	TDA-01	Mechanisms exist to facilitate the implementation of tailored development and acquisition strategies, contract tools and procurement methods to meet unique		Example 1: Record lessons learned through root cause analys in a wiki that developers can access and search. Example 2: Plan and implement changes to the appropriate SDLC practices.
DV 2.4	N/4	Review the SDLC process, and update it if appropriate to prevent (or reduce the likelihood of) the root cause recurring in updates to the software or in new software that is created. Cy Functional Intersects With Privac	Product Management	TDA-01.1	Mechanisms exist to design and implement product management processes to update products, including systems, software and services, to improve functionality and correct				
RV.3.4	N/A		Functional	Intersects With	Cybersecurity & Data Privacy Representatives For Product Changes	TDA-02.7	Mechanisms exist to include appropriate cybersecurity & data privacy representatives in the product feature and/or functionality change control review process.		
			Functional	Intersects With	Secure Coding	TDA-06	Mechanisms exist to develop applications based on secure coding principles.
